

GREENSPROUT / KENYA

Investment opportunity

Lawn care and sod installation today. A proposed expansion into hydroseeding, erosion control and land rehabilitation.

Preliminary discussion brief · October 2026 | 0700 355 113 | info@greensprout.com

This brief describes a proposal. Figures, supplier specifications and commercial assumptions require verification.

The business direction

GreenSprout is developing connected services for Kenyan landscapes, from established lawns to specialist ground cover on difficult sites.

AVAILABLE NOW

- **Lawn care & maintenance**

Professional mowing and upkeep for existing lawns and larger grounds.

- **Sod installation & landscaping**

Ground preparation and natural turf installation for new or renewed landscapes.

PLANNED SPECIALIST SERVICES

- **Hydroseeding & hydromulching**

A slurry application method proposed for prepared ground, larger areas and selected difficult terrain.

- **Erosion control & rehabilitation**

Proposed vegetation establishment for exposed slopes and disturbed land, subject to site design, testing and delivery capability.

Where this may fit

Homes and estates, developments, institutions, hospitality grounds, infrastructure sites and restoration projects. Each site needs an assessment and a suitable method; hydroseeding will not replace sod or routine lawn care in every case.

Positioning: use today's client work and site knowledge as a starting point while building technical readiness for specialist work. No specialist launch or performance result is represented as complete.

Proposed launch package

The original founder brief set a provisional KSh 15 million target for a complete specialist launch, rather than only a machine purchase.

KSh 15M

Indicative target from the original brief. It is not a supplier quotation, confirmed financing requirement or valuation.

PROPOSED USES OF CAPITAL

- **Equipment and import**

The VORTEC VX2000 was shortlisted in the founder brief; model, configuration, price, freight, duties, tax and warranty need confirmation.

- **Operational readiness**

Hoses, nozzles, spares, transport, servicing support, safety procedures and operator commissioning.

- **Market entry**

Controlled demonstrations, documentation, client education and early sales development.

BEFORE COMMITMENT

- **Verify the numbers**

Obtain a formal supplier quotation and freight and import estimates. The original budget ranges should be rebuilt into a reconciled working model.

- **Validate the business case**

Test suitable pilot applications, costs, demand, pricing and aftercare requirements before claiming predictable returns.

- **Agree the structure**

Any equity, loan, asset-backed or other proposal requires separate diligence, negotiation and legal review.

A practical discussion

GreenSprout welcomes investors and strategic partners who want to examine the opportunity with a clear view of its early-stage risks.

PROPOSED SEQUENCE

01 Scope the opportunity

Exchange background, strategic fit and the intended scale of the specialist service.

02 Confirm technical and financial assumptions

Obtain supplier documentation, a revised landed-cost budget and proposed milestones.

03 Test and decide

Agree pilot criteria, delivery readiness and a suitable commercial structure after due diligence.

MAIN UNCERTAINTIES

Equipment specification and import costs; field performance; site-specific vegetation outcomes; client adoption; trained operators and maintenance; approvals and contract terms. Target segments and a proposed implementation sequence are planning assumptions, not signed commitments.
